

CLOUD COST ESTIMATION DASHBOARD

Cloud Cost Estimator: Visualising Your Savings

Concise overview of an intelligent estimator that turns cloud usage into clear savings opportunities. Designed for FinOps, engineering leads and product owners.

The Cloud Conundrum: Why Cost Optimisation Matters

Cloud spend can spiral without visibility: fragmented bills, idle resources, over-provisioning, and unpredictable growth. Optimisation drives immediate savings and sustainable practices.

Visibility

Single view across accounts, tags and projects to reveal hidden spend.

Control

Policies and alerts to prevent waste before it occurs.

Efficiency

Right-size recommendations and reserved instance planning.

Introducing Our Cloud Cost Estimator: A Glimpse

Interactive UI that converts usage inputs into clear cost projections and recommended actions. Designed for fast decisions and executive summaries.

Core UI elements

- Guided input: workload profiles and historical usage import
- Instant preview: projected monthly and annual costs
- Actionable recommendations: rightsizing, commitments, scheduling

☐ Theme accent: #A95B95 used for CTAs, highlights and graph accents.

How It Works: Diving into the Data

This five-step pipeline ingests billing and telemetry, normalises resources, models usage patterns, projects costs under scenarios, and outputs ranked optimisation actions.

Key Features & Functionality

Rightsizing Engine

Automated recommendations tuned by utilisation percentiles and performance constraints.

Scheduling & Automation

Turn off non-production resources during idle windows to reduce hourly costs.

Commitment Planning

Compare on-demand vs reserved/savings plans with break-even analysis.

Tagging & Governance

Enforce consistent tags, allocate costs by team or product, and set budget guards.

Use Cases & Benefits: Real-World Impact

Case Study: SaaS Platform

Before: unpredictable monthly peaks and 25% idle capacity.

After: scheduled shutdowns + rightsizing reduced monthly spend by 32% and improved cost predictability.

Business Benefits

Lower OpEx, clearer budgets, faster decisions, and better engineering accountability.

Case Study: Data Analytics

Migration of batch jobs to spot instances with fallback reduced compute costs by 45% while preserving SLAs.

Technical Benefits

Reduced waste, better utilisation, and standardised tagging for traceability.

Our Research & Development: The Science Behind It

Models calibrated against historical billing datasets and synthetic workloads. Evaluation focuses on prediction error, false positives for rightsizing, and SLA-safe recommendations.

Accuracy improved through feature engineering (seasonality, commit-history) and ensemble modelling. Peer-reviewed validations and internal A/B tests support results.

Data-Driven Decisions: Reports & Analytics

Sample Report Types

- Executive summary: monthly spend, top saving opportunities, forecast
- Team-level reports: tagged allocation and anomaly alerts
- Resource transcripts: per-instance usage and rightsizing history

① Exportable to CSV, PDF and automated weekly emails for stakeholders.

Future Enhancements & Roadmap

Planned releases focus on automation, broader cloud coverage, and deeper integrations with CI/CD and FinOps toolchains to reduce manual effort and accelerate savings.

Q3

Real-time anomaly detection and alerting

Q4

Multi-cloud support with unified currency and exchange handling

Q1

Automated purchasing for long-term commitments with guardrails

Q2

Policy-as-code for enforcement and cost governance

Q&A and Next Steps: Start Estimating Today!

Ready to quantify savings? Get started by importing your billing data, or request a demo.

- Book a demo: contact@cloud-estimator.example (placeholder)
- Try the estimator: self-serve onboarding with sample datasets
- Next step: pilot project to measure first-month savings

✔ Contact our team to schedule a tailored pilot and access technical docs and datasets.
